PRD: TVK War Room Social Listening, Phase 1 (X + News)

Nov 3, 2026 · @Kishore

Status: Draft for CTO review. Owner: Kishore (Minsky product).

Goal: give the TVK war room one live, trustworthy picture of how X and the news are talking about TVK, CM Vijay and Aadhav Arjuna, with an AI co-worker that explains it and alerts the team in time to act.

Phase: this is Phase 1 (X and news). Later phases add WhatsApp, Instagram and Facebook, then team-approved counter-campaigns, and then the product is generalised for other political parties and for any organisation or business whose public perception matters. TVK is the first client, not the only one. This PRD sets the requirements; architecture, ADRs and build slices are the CTO's next step.

Decisions already made (by the founder, 2026-11-03, unless noted):

Area	Decision
Sources in Phase 1	X; news from the web (feeds, plus crawling news websites directly); e-paper from the war room's existing subscriptions; and the daily manual newspaper clippings
Users	War-room media, social media and content teams; the war-room big screen; CM Vijay; Minister Aadhav Arjuna as head of the war room
Languages	Content in Tamil, English and Tanglish; app interface in English and Tamil
Freshness	As low as possible; target 5 minutes from post to screen
Who we track	TVK, CM Vijay, Aadhav Arjuna, and all Indian political parties, with alliance partners watched as closely as the opposition

Area	Decision
Alerts	Big screen, in-app, and WhatsApp to team leads (response opportunities go to Sajan, the named lead, who briefs Aadhav Arjuna); weighted by how important the account is, not only by volume
Campaigns	Detecting coordinated anti-TVK campaigns, including surrogate accounts, is part of Phase 1
Corrections	The team can correct any AI label; the system keeps learning from corrections and, as its measured error falls, takes on more work as a co-worker
History	From 2026-05-10, the day the TVK government was sworn in
Budget	No monthly cap; cost efficiency still designed in at every step
Posting	The app does not post or campaign in Phase 1; counter-campaigns are a later phase
Principle	Easy to understand on top, statistically and technically correct underneath

Inputs used: Minsky's own X API research and Minsky's experience building news curation for StartupTN.

Glossary:

Term	Meaning
Mention	One item matched to a tracked entity: a post, reply, quote, article, clipping or e-paper story.
Entity	Something we track: TVK, CM Vijay, Aadhav Arjuna, every party, and key leaders. Each party carries a Relationship tag: ally, supporting, opposition or neutral.
Story	All Mentions about the same happening, across X and news, fused into one item with its reach.

Term	Meaning
Influence score	How much one account or outlet matters: verified status, followers, engagement, and a staff-curated standing tier.
Severity	How urgently a Story or post needs the team: influence x negativity x velocity. Decides which tier an alert reaches.
Campaign	A coordinated push of a narrative by many accounts (including surrogate or proxy accounts), detected from posting patterns.
Gold set	Real items labelled by the war room, used to test every filter and label before thresholds are set.
Calibration	The first weeks of live use, when thresholds are tuned against the gold set and the team's act/dismiss decisions.
Co-worker	The AI agent at the centre of the app, shown with the TVK elephant avatar.

Problem Statement & JTBD

The TVK war room learns about important moments too late. That includes attacks it must answer and openings it should use, and it cannot tell real public anger from a manufactured push. Today the team watches X by hand, cuts newspapers with scissors every morning, and reads e-papers one by one. However hard the team works, this setup cannot keep up. The first example below is a real recent incident; the others show the other kinds of things that get missed.

What gets missed today

1. **The missed chance to respond (real incident).** A councillor spoke ill of CM Vijay at a DMK function, with DMK's deputy general secretary on stage. The remark was condemned widely, but the war room missed it and did not tell Aadhav Arjuna, so he did not tweet a condemnation while it was the story of the moment. He was upset: it was political mileage TVK lost, and it handed the moment to others. *Why it gets missed:* the

remark started at an event, spread through video and news, and the signal that mattered was not negative volume about TVK but everyone else condemning it while TVK said nothing. Nobody was watching for "others are reacting and we haven't".

2. **The one post that mattered** *(illustrative)*. A verified national journalist with over a million followers posts a sharp criticism of CM Vijay at 9 p.m. It is one post, not a spike, so nobody watching volume notices. By morning it has 8,000 reposts and national TV picks it up. *Why it gets missed:* a volume count treats that post the same as one from an account with 40 followers.
3. **The surrogate wave** *(illustrative)*. At 11 p.m., 300 accounts, most under three months old, post near-identical Tanglish lines against Aadhav Arjuna under a new hashtag. It trends in Chennai before the team wakes up. *Why it gets missed:* each account looks ordinary on its own. The pattern only shows across accounts and time, which no person scrolling a feed can see.
4. **The ally going quiet, then loud** *(illustrative)*. An alliance partner's MLAs start posting unhappiness about a cabinet decision. The team is watching opposition parties, so the ally's posts are not on anyone's list. *Why it gets missed:* the team tracks rivals by habit, but in a coalition an ally's discontent needs the fastest response.
5. **The print story that never went online** *(illustrative)*. A Tamil weekly's political column runs an anonymous insinuation about a minister. It is in the print edition and the e-paper, but not on the outlet's website. The clipping sits in a pile; nobody connects it to the X chatter two days later. *Why it gets missed:* print, e-paper and X live in separate places, so one Story never comes together.

Why simple fixes won't work

- *More people watching:* volume beats headcount, people sleep, and they cannot see cross-account patterns or Tamil code-mixed sarcasm at scale.
- *Keyword alerts:* "Vijay" matches film fans; criticism of a department often never names the minister; and keyword counts treat every account the same.
- *Off-the-shelf listening tools:* weak on Tamil and Tanglish, no notion of TVK's allies and opponents, and no way for the war room to correct them.

Job to be done

When public conversation about TVK, CM Vijay or Aadhav Arjuna shifts on X or in the news, *I want to* see what is happening, how much it matters, whether it is organic or coordinated, and whether we should respond, with the evidence one tap away, *so I can* respond before the narrative sets.

Cost of not solving it: the opposition sets the narrative first; chances for political mileage pass while TVK is silent, as in the councillor incident; the war room reacts to stories that have already peaked; leadership hears of problems from outside before hearing from its own team; and with a coalition government, missing an ally's discontent risks the government itself.

Proposed Solution & Scope

Core idea: one system that collects everything said about TVK on X and in the news, labels and weighs it, groups it into Stories, spots coordinated campaigns, and alerts the war room, with an AI co-worker that explains all of it.

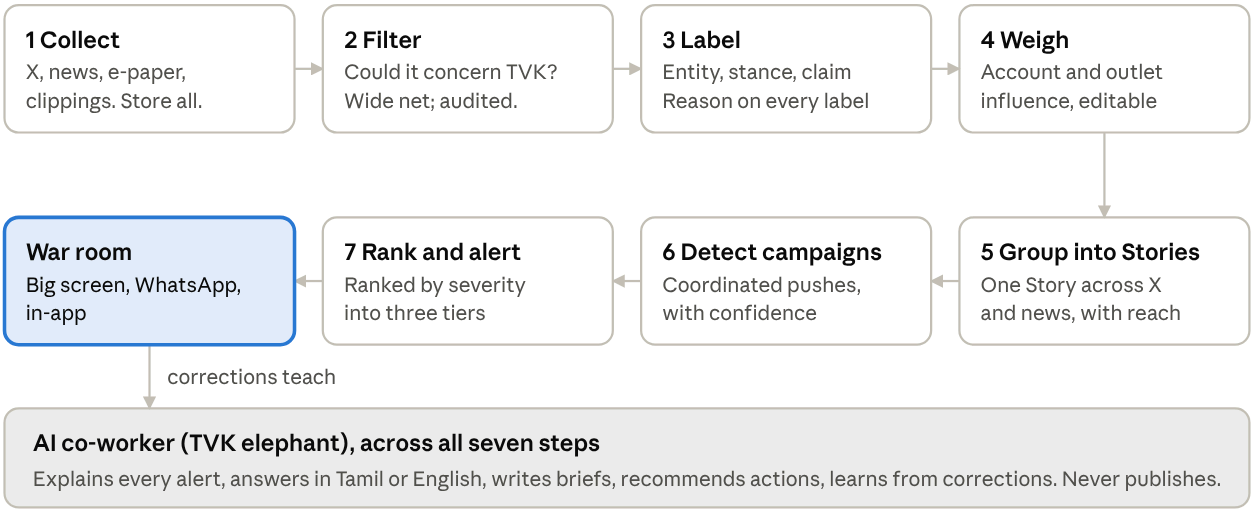

How it works, in seven steps:

1. **Collect.** Bring in X posts with their engagement and author profiles, online news (news sitemaps and RSS where outlets publish them, crawling news websites directly where they don't, a search API to find stories on sites we don't track yet, and TV channels' YouTube feeds), e-paper editions from the war room's subscriptions, and the morning's scanned clippings. Keep everything, so filters can be re-run later. If any source stops, the screen says so.
2. **Filter.** Keep anything that could concern TVK, using watch terms (names, nicknames, Tamil and Tanglish spellings, hashtags) and topic similarity. The filter is set wide on purpose: letting in too much is fine, missing something is not. A weekly audit checks a sample of what was filtered out.
3. **Label.** For each item, record which entities it is about, the stance toward each (positive, negative, neutral, sarcastic), whether it is an attack, who stands behind the claim (on record, named source, anonymous insinuation, satire) and the language. Every label shows its reason. Items the system is unsure about go to a stronger model or a person.
4. **Weigh.** Score every account and outlet by verified status, followers, how fast engagement is growing, and a tier the staff maintain (national media, state media, party leaders, influencers). Every weight is visible and editable.
5. **Group into Stories.** Put items about the same happening together across X and news, with reach split by source type ("9 outlets, 1,200 posts"). Rumours about our entities show up even from a single source. Staff can merge or split Stories.
6. **Detect campaigns.** Look for coordination: new or low-history accounts clustering, near-identical text, posts timed together, accounts boosting each other, a hashtag pushed by a small network. Each detection shows its confidence and evidence. A

person confirms before any party is named as behind it.

7. **Rank and alert.** Rank everything by severity. The top tier flashes on the big screen and goes to team leads on WhatsApp; the next tier stays in-app. The number on the big screen is capped so it never floods.

Seven steps turn raw posts and news into ranked alerts

how it works · 7 steps, the war room, the co-worker

Items move through the seven steps to the war room; the team's corrections go back through the co-worker and improve the system.

The **co-worker** works across all seven steps. It answers questions in Tamil or English, explains every spike and alert with the posts behind it, writes the CM summary and shift handovers, recommends actions, and learns from every correction the team makes. It reads, analyses, alerts and drafts. It never publishes.

How the co-worker grows into a co-worker. It keeps learning the war room's patterns: which posts the team calls negative, which alerts it acts on, which moments it responds to, and what each correction says. Every capability (labels per language, spike and influence alerts, campaign flags, response suggestions, briefs) moves up a ladder only when measured accuracy on the team's own corrections earns it, and drops back if errors rise.

Stage	What the co-worker does	What people do
1. Assist	Suggests labels, alerts and responses.	Review most of its output; correct freely. Every correction teaches it.

Stage	What the co-worker does	What people do
2. Trusted	Acts alone on the capabilities that have cleared their accuracy bar.	Spot-check a sample; review only low-confidence and high-stakes items.
3. Co-worker	Handles routine monitoring, labelling, alerting and briefing end to end, and raises only what needs a decision.	Make the decisions and handle exceptions.

The bars for moving up are set during calibration from real correction data, not guessed. Even at stage 3, the co-worker does not post, reply or publish in Phase 1, and naming a party behind a campaign always needs a person.

How the war room will use it: a typical day

Meena leads the social media team. `[Assumption: illustrative persona]`

- **06:30, phone.** WhatsApp from the co-worker (elephant avatar): "Overnight: 1 high alert. A new hashtag against Aadhav Arjuna, pushed by about 300 accounts, 70% under 3 months old. Possible coordinated campaign, confidence medium. Tap for evidence." She taps and sees the accounts, the shared phrasing and the timeline.
- **07:15, upload.** An intern scans the morning's clippings and uploads them. Within the hour each becomes a Mention; one clipping joins the overnight hashtag Story as "also in print: Junior Vikatan".
- **09:00, big screen.** The wall shows sentiment for TVK, CM Vijay and Aadhav Arjuna (with "of N mentions"), an Ally Mood panel, the three most severe active alerts, and the top rising Stories. Every number shows when it was last updated.
- **11:40, desktop.** The screen flashes red: a verified national journalist criticises CM Vijay. Reason shown: "verified, 1.2M followers, national media tier, 4,000 reposts in 20 minutes." Meena acknowledges and assigns it to the content team; the flash clears for everyone.
- **12:10, desktop.** She asks the co-worker in Tamil why Congress mentions turned negative. It answers with three posts from Congress MLAs about the cabinet decision, the share of negative Ally mentions before and after, and a note that the sample is 64 posts.
- **15:30, desktop.** She disagrees with a label: a Tanglish post marked Negative is sarcastic support. She changes it to Positive (sarcastic) with a one-line reason. The original label stays visible in history.

- **18:00, CM visit.** The screen switches to presentation-safe mode. CM Vijay reads the 30-second summary: what changed today, why, and what needs a decision.
- **22:00, handover.** The co-worker drafts the shift handover: open alerts, who owns them, and what to watch overnight.

In scope (Phase 1)

Item	Note
X ingestion	Posts, replies, quotes, engagement, author profiles; history from 2026-05-10.
News ingestion	Tamil and English outlets from the web: feeds where available and direct crawling of their websites, plus TV news sites and YouTube channel feeds.
E-paper ingestion	From the war room's existing subscriptions, with Tamil text recognition.
Clipping upload	Daily scans of the manual newspaper cuttings, turned into Mentions.
Entities and relationships	TVK, CM Vijay, Aadhav Arjuna, all Indian parties and key leaders, each party tagged ally, supporting, opposition or neutral (staff-editable).
Sentiment and stance	Per entity, in Tamil, English and Tanglish, with a reason per label.
Influence and weighting	Account and outlet influence scores; weighted scores always shown beside raw counts.
Stories across X and news	One Story per happening, reach split by source type.
Alerts	Volume spikes, influence triggers and campaign signals, ranked by severity into big screen, WhatsApp and in-app tiers.
Campaign detection	Coordination signals with confidence and evidence; human confirmation before naming a party.

Item	Note
Three views	Big screen, CM summary, team drill-down to the original posts and articles.
AI co-worker	Q&A, explanations, briefs, handovers, recommendations, memory; elephant avatar.
Human correction and learning	Any AI output can be corrected; corrections improve the system, with a bias guard.
Interface languages	English and Tamil.

Out of scope (Phase 1)

Item	Reason
Publishing, replying or campaigning from the app	Founder's word, 2026-11-03: first bring in data, analyse and act manually. Automated counter-campaigning is a later phase, within platform rules.
WhatsApp group monitoring	Later phase, with its own legal review.
Instagram and Facebook	Later phase; access method still to be researched.
Other clients (parties, organisations, businesses)	Later phase. Phase 1 serves TVK only, but is built so a new client needs setup, not new code (see AI/Tech Constraints).
Multiple X accounts or apps to get past limits	Breaks X's Developer Policy and risks losing API access. Scale comes from enterprise access or a licensed vendor.
Profiles of private citizens	Analysis covers conversations and public actors only.
Paywalled content beyond what subscriptions allow	Only content the war room is entitled to read is ingested.
Draft responses in the client's voice	The co-worker suggests actions; writing posts in TVK's voice is its own project.

User Stories & Acceptance Criteria

Thirty-five stories in eleven groups. Acceptance criteria describe what a person sees, never internal mechanics. Numbers marked *default* are starting values for calibration, not decisions.

A. Seeing the picture

1. As a war-room staffer, I want the big screen to show sentiment for TVK, CM Vijay and Aadhav Arjuna at a glance, so that nobody has to open a laptop to know where we stand.

- Given the big screen is on, when a new Mention is processed, then within 5 minutes of the original post (client word) the entity's sentiment updates and shows "of N mentions, last updated HH:MM".
- Given an entity has fewer Mentions in the window than the minimum sample (*default* 30), then the screen shows "not enough data" instead of a percentage.

2. As CM Vijay, I want a summary I can read in 30 seconds, so that I know what changed, why, and what needs a decision.

- Given CM mode is opened, then the summary shows at most three changes since the last summary, each with its cause in one line and one tap to the evidence, in English or Tamil.
- Given the summary attributes a change to an ally, then it carries "reviewed by <name>" or is held until a lead reviews it.

3. As a team member, I want every number to open the posts and articles behind it, so that I respond to the real thing, not a paraphrase.

- Given any number or Story, when I tap it, then I see the underlying Mentions with author or outlet, engagement, time, label and the label's reason, and a link to the original.

4. As a war-room lead, I want a presentation-safe mode for visitors and the CM, so that private-citizen handles and internal notes never appear on the wall.

- Given presentation-safe mode is on, then the big screen shows only aggregates, public actors' names and Story titles.

B. Knowing who matters

5. As a social media lead, I want a single critical post from an important account to alert us even with no volume spike, so that the one post that matters never waits until morning.

- Given a verified account in the national media tier posts negatively about a tracked entity, when its engagement crosses the influence trigger (*default*: severity in the top tier), then within 5 minutes of the post the big screen flashes and team leads get a WhatsApp, with the reason, e.g. "verified, 1.2M followers, national media, 4,000 reposts in 20 min".

6. As a war-room lead, I want to edit the standing tiers (national media, state media, party leaders, influencers), so that the system knows who matters in Tamil Nadu politics.

- Given I add a handle to a tier, then new Mentions from it are weighted by that tier, and the change appears in the tier audit log with my name and time.

7. As a team member, I want weighted scores always shown beside raw counts, so that I can see when one viral account is driving the number.

- Given a weighted sentiment, then the raw count and the top three contributing accounts are one tap away, and no single post contributes more than the cap (*default* 5%) to an entity's score.

8. As a war-room lead, I want alerts ranked so only the most severe reach the big screen, so that the wall never becomes noise.

- Given several alerts are active, then the big screen shows at most three (*default*), related posts are grouped into one alert, and lower tiers stay in-app.
- Given an alert fires, then anyone can acknowledge or assign it, and the flash clears for everyone with "taken by <name>".

C. Volume spikes

9. As a staffer, I want to know when negative talk about an entity rises well above normal, so that we catch a building wave early.

- Given negative Mentions for an entity rise above baseline (*default*: same hour over the last 14 days, 3 standard deviations, at least 2x normal, at least 25 Mentions, over 15 minutes), then a spike alert appears with the baseline, the current level and the top posts driving it.
- Given a scheduled event (rally, assembly session, results day) is marked in the calendar, then that window uses its own baseline.

D. Coordinated campaigns

10. As a social media lead, I want to see when a narrative is being pushed by coordinated or surrogate accounts, so that we can respond before the opposition sets the narrative.

- Given a cluster of accounts posts near-identical text or a shared hashtag in a short window, then a "possible coordinated campaign" alert shows the accounts, account ages, shared phrasing, timing chart and a confidence level.

11. As a war-room lead, I want naming a party as behind a campaign to need a person's confirmation, so that a false accusation never reaches leadership as fact.

- Given a campaign alert, then it reads "possible coordination" until a lead confirms attribution, and the confirmation is logged with name and reason.

12. As a staffer, I want a campaign's spread tracked over time, so that I know whether our response is working.

- Given a confirmed campaign, then its page shows Mentions per hour, new accounts joining and our response Stories on one timeline.

E. Allies and all parties

13. As a war-room lead, I want an Ally Mood panel, so that discontent from coalition and supporting partners reaches us first.

- Given Mentions from an ally's public figures (official handles, MPs, MLAs, spokespeople) turn negative toward TVK, then the Ally Mood panel shows it with the people and posts, and an alert fires at the ally threshold.

14. As a lead, I want to change a party's relationship tag, so that the system follows real politics.

- Given I change a party from ally to opposition, then alerts and panels use the new tag from that moment, and history keeps the old tag for past periods.

F. News, e-paper and clippings

15. As a staffer, I want X posts and news articles about the same happening fused into one Story, so that I see the full picture in one place.

- Given 9 outlets and 1,200 posts cover one statement, then one Story shows "9 outlets, 1,200 posts" with both lists.

16. As a staffer, I want the morning's scanned clippings turned into Mentions, so that print-only stories join the same picture.

- Given an intern uploads scans, then each becomes a Mention with outlet, date and page, and low-confidence text recognition is marked "check scan".

17. As a staffer, I want e-paper editions from our subscriptions ingested daily, so that weeklies and print-first stories are not missed.

- Given an e-paper edition is published, then its stories appear as Mentions tagged "e-paper", with page images one tap away.

18. As a staffer, I want each outlet's weight shown with its reason, so that a party-owned channel never counts like an independent daily.

- Given a news Mention, then its outlet tier and reason are visible (e.g. "state daily, Tamil, high reach" or "party-affiliated channel").

19. As a staffer, I want anonymous insinuations about our entities surfaced even from one source, so that a rumour in a weekly column reaches us the same day.

- Given a single item labelled anonymous insinuation about a tracked entity, then it appears as a Story of one, marked "unattributed".

G. The co-worker

20. As a social media lead, I want to ask the co-worker in Tamil why sentiment changed, so that I can decide whether to respond.

- Given I ask a question, then the answer arrives in the language I used, cites the posts behind every claim, gives counts that come from the data, and says "not enough data" when that is true.

21. As a team lead, I want the co-worker to explain each alert as it fires, so that I understand it without digging.

- Given an alert, then it carries a two-line explanation and the evidence.

22. As a lead, I want the co-worker to draft shift handovers and the CM summary, so that context survives shift changes.

- Given a shift ends, then a handover draft lists open alerts, owners and what to watch, for a person to edit and send.

23. As a team member, I want the co-worker to recommend actions without taking them, so that the team stays in control.

- Given a recommendation, then it is shown as a suggestion with its reason and the co-worker has no way to post, reply or publish.

H. Correcting the machine

24. As a team member, I want to correct a wrong label, so that my context fixes the system's mistake.

- Given I change a label, then the new label shows with "corrected by <name>", the original stays in history, and aggregates update with corrected counts identifiable.

25. As the Minsky team, I want corrections to improve the system, so that it gets better at the war room's language every week.

- Given corrections accumulate, then they join the gold set and the co-worker's examples, and a weekly accuracy chart shows model-only vs. corrected agreement.

26. As a war-room lead, I want a guard against relabelling criticism as neutral, so that the dashboard stays honest.

- Given a correction makes a negative label about our entities softer, or touches a high-severity Story, then it needs a second reviewer before it changes aggregates, and the model-only view stays available.

I. Operating honestly and failure paths

27. As the Minsky team, I want a weekly audit of a sample of what the filter left out, so that "we are not missing news" is a measured number.

- Given the weekly audit, then reviewers re-label a sample stratified by source, language and entity, and the missed-item rate is shown on the admin page.

28. As a staffer, I want to see when a source is down or delayed, so that a quiet screen never fools us.

- Given X, a news source, e-paper or the AI model fails or lags, then the affected panels show "data delayed since HH:MM" with the source named, and no number silently stops updating.

29. As a team lead, I want to know if a WhatsApp alert could not be delivered, so that a critical alert is never lost.

- Given a WhatsApp alert fails, then it retries, the in-app alert shows "WhatsApp not delivered", and a lead is notified in-app.

30. As an admin, I want data usage against platform limits shown, so that we never hit a cap by surprise.

- Given X reads reach 50%, 80% and 95% of the monthly cap, then admins are alerted, and any sampling is labelled on every affected number.

J. Response opportunities

31. As Sajan, the named lead for response opportunities, I want to be told the moment something calls for TVK's response, so that Aadhav Arjuna can react while it is still the story, unlike the councillor incident.

- Given an attack on a tracked entity is drawing condemnation from other parties, media or public figures, and no TVK leader account has responded, when it crosses the response trigger, then Sajan gets a WhatsApp "Response opportunity" within 5 minutes of the trigger (client freshness target), showing the clip or article, who is already reacting, and "no TVK response yet".
- Given a TVK leader posts a response, then the opportunity shows "responded by <name> at HH:MM" and stops alerting.

32. As a war-room lead, I want a response queue of Stories likely to need a reaction (condemn, rebut, congratulate, condole), so that nothing worth reacting to passes in silence.

- Given a Story in the queue, then it shows the suggested kind of response, who else has reacted, time since it started, and TVK's response status, read from TVK leaders' own accounts.
- Given a lead marks an item acted on or not needed, then that choice is recorded and teaches the queue what deserves a response.

33. As a staffer, I want remarks made at events and on TV captured from news reports and TV channels' YouTube videos, so that something said on a stage reaches us even before it is widely written up.

- Given a news report or a TV channel video quotes a remark about a tracked entity, then it becomes a Mention linked to the article or video, with the quoted line and the speaker where known.

K. The co-worker earning trust

34. As Aadhav Arjuna, I want the co-worker to take on more of the routine work as it proves itself, so that the team spends its time on decisions, not monitoring.

- Given a capability's measured accuracy on the team's corrections stays above its bar for the agreed period, then it moves up a stage (Assist, Trusted, Co-worker), and the admin page shows each capability's stage and its error trend.

35. As the Minsky team, I want a capability to drop back a stage automatically if its error rate rises, so that trust is earned continuously, never assumed.

- Given a capability's accuracy falls below its bar, then it returns to the previous stage, human review resumes for it, and leads see why.

AI/Tech Constraints

These are requirements and limits, not designs. Each number is labelled: **client** (a target the build must meet), **measured** (a fact with its source), or **default** (a starting value, final value set by calibration).

Freshness and volume

Requirement	Value	Kind
Post to screen and to alert, X	5 minutes or less, as low as possible	client, 2026-11-03
Online news to screen	As fast as the outlet's feed allows; the floor per source type to be stated by the CTO	client intent
E-paper and clippings	Same morning they are published or uploaded	client intent
History	From 2026-05-10 (TVK government sworn in)	client
Daily volume	Unknown; to be measured in the first two weeks	owed

Data sources and limits

- **X:** pay-as-you-go caps at 3M post reads a month, about 100k a day (measured, Minsky X API research). Tracking all parties plus campaign detection will likely exceed that, and the history backfill certainly will. There is **no budget cap** (founder, 2026-11-03), so

the limit is the platform, not money: the likely route is X enterprise access or a licensed firehose vendor. Multiple apps or accounts to get past limits is ruled out (X Developer Policy).

- **X display rules:** showing post text on the wall screen may fall under X's display requirements for offline or broadcast use. To be confirmed before launch.
- **News:** ingest from feeds (news sitemaps, RSS, YouTube channel feeds) where outlets publish them, crawl outlets' websites directly where they don't, and use a search API to find stories on sites not yet tracked. Crawling follows each site's robots.txt and terms, identifies itself and paces its requests. A crawl error must never look like "no new articles": each site's health is shown to admins. Store metadata, headline, a short snippet and the link, not full text, unless licensed.
- **E-paper:** only from subscriptions the war room holds. Whether the subscription terms allow automated ingestion is a fact owed per publisher. Tamil text recognition is required; low-confidence text is marked.
- **Clippings:** scans uploaded by staff. Treated like e-paper.
- **Cost:** no cap, but efficiency is designed in: cheap counts before expensive reads, no item paid for twice, cheap classification for every item and the strong model only for reasoning, summaries and Q&A.

Language

- Tamil script, English, Tanglish (Tamil in Latin letters) and mixed posts. X's language tag is not reliable for Tanglish, so language detection is our own.
- Accuracy is measured **per language** on the gold set. *Default* targets: F1 0.80 English, 0.75 Tamil, 0.72 Tanglish. Final targets are set when the gold set is built.
- Tamil numerals and amounts must be read (a known gap in earlier Minsky news work).

Statistics and weighting

- Every percentage shows its denominator. Below the minimum sample (*default* 30) the screen says "not enough data".
- A change is called a change only when it clears a significance test or a confidence interval; noise is not shown as a trend.
- Influence and outlet weights are documented, versioned and staff-editable, with log-scaled followers and a per-post cap (*default* 5%). Raw counts always sit beside weighted scores.
- Suspected bot accounts are down-weighted, and that is shown.

- Sampled numbers are always labelled as sampled.

The co-worker (agent)

- **Sees:** TVK leaders' own posts (to know whether TVK has responded), all Mentions, Stories, alerts, history from 2026-05-10, party relationships, standing tiers, past corrections, and what the team did about past alerts.
- **Can do on its own:** read, query, count, compare periods, explain, summarise, flag on screen.
- **Does on its own but logged:** send WhatsApp alerts to team leads.
- **Needs a person:** naming a party as behind a campaign; any summary blaming an ally that goes to the CM.
- **Cannot do in Phase 1:** post, reply, publish or message anyone outside the war room.
- **Grounding:** every claim cites its Mentions; every number comes from a data query, never the model's own arithmetic. If the data does not support an answer, it says so.
- **Memory:** remembers past spikes, recurring narratives, actions taken and their outcomes; memory is correctable; it never stores private individuals' details.
- **Answer time:** *default* first answer within 10 seconds for a typical question.
- **Language:** answers in the language asked.
- **Safety:** all ingested content is data, never instructions. A post saying "ignore your instructions" is treated as a post.
- **Evals:** a fixed set of real war-room questions with checked answers, run on every model or prompt change, scoring accuracy, citation correctness and saying "I don't know" when right.
- **Audit:** every answer and alert logged with its inputs, sources used, and model and prompt version.
- **Identity:** elephant avatar from the official TVK logo artwork supplied by the party, not redrawn. Name and voice to be confirmed with the client.

Human correction and learning

- Any AI output can be corrected: sentiment, entity, stance, attribution, severity, campaign flag, agent answer.
- Original output is kept beside the correction, with who, when and why. Nothing is overwritten.

- Corrections feed the gold set, the co-worker's examples and periodic re-tuning, so the system keeps learning the war room's patterns. Accuracy over time is visible per capability. Each capability moves Assist, Trusted, Co-worker only when its measured accuracy clears its bar (set in calibration), and drops back automatically if errors rise.
- Bias guard: correction rates tracked per person and per entity; softening corrections about our entities and high-severity changes need a second reviewer; a model-only view is always available.

Privacy, audit and reproducibility

- Staff-only access. No links to citizen or petition records. No views centred on private individuals.
- India's DPDP Act 2023 and its Rules apply to any personal data stored.
- Every label and score can be reproduced: model, prompt, weight and threshold versions are logged.
- Staff-editable settings (watch terms, relationship tags, standing tiers, outlet weights, thresholds) are data rows, changeable without a deploy, and audit-logged.

Built to generalise

Phase 1 is for TVK, but later phases will serve other parties and any organisation or business whose public perception matters. So nothing TVK-specific is hard-coded:

- Tracked entities, relationship tags (for a business: competitors, partners, regulators), standing tiers, watch terms, outlet lists and weights, languages, alert recipients, thresholds and the co-worker's name and avatar are all per-client settings.
- A new client is set up through configuration and a client profile, with no code changes.
- Each client's data, corrections, gold set and co-worker memory are kept fully separate. One client's corrections never change another client's labels.
- Words on screen like "party", "ally" and "CM summary" come from the client's settings, so a brand sees "competitor" and "leadership summary".

This is a requirement on Phase 1, not a Phase 1 feature: the build should not make generalising later a rewrite.

Failure behaviour

- Every third-party dependency has a designed, visible fallback: X API, each news source, e-paper, the AI model, WhatsApp delivery.

- If the AI model is down, dashboards keep working without the co-worker, which says its data is stale rather than answering from old data.
- A source error never looks like "no new items".

Open decisions for CTO

Decision	Options and what each means for users
How X data is obtained	Pay-as-you-go: cheapest start, but coverage capped at 3M reads a month and backfill partial. Enterprise or firehose vendor: full coverage and backfill, higher cost, contract lead time. Talks should start now.
How fast X is fetched	Frequent polling may meet 5 minutes on normal days but strain on spike days; a streaming feed meets it reliably but needs enterprise or vendor access.
How news websites are crawled	Generic article extraction covers most sites with little upkeep; site-specific rules are more accurate but break when sites change; JavaScript-heavy sites need a headless browser, which is slower and costlier. Affects how fast and how completely news appears.
One model or per-language models for labels	One model is simpler; separate models may lift Tanglish accuracy at higher cost per item. Decide on gold-set results.
E-paper and clipping text recognition	Build or buy Tamil text recognition; decide on accuracy on real pages.
Story merging across X and news	Merge rules affect what "reach" means on screen; staff need a way to merge and split.
Where the co-worker's memory lives and how it is corrected	Affects how quickly corrections change its answers.

Key Metrics & Success Criteria

Success means the war room hears about what matters first, trusts what it sees, and acts on it. Baselines are unknown until the first two weeks of measurement; targets marked "calibration" are set from the gold set and live act/dismiss data.

Leading indicators (days to weeks)

Metric	Why it matters	How measured	Target
Post-to-screen time, p95	The team acts immediately	Timestamps from post to display	5 minutes or less (client)
Alert usefulness	Alerts the team acts on, not mutes	Share of alerts acknowledged and acted on vs. dismissed	Calibration (*default* 60%)
Time to alert on a spike or influence trigger	Catching it before it peaks	Spike start vs. alert time, on real events	Calibration
Label accuracy per language	Trust in every number	F1 on the gold set, English / Tamil / Tanglish	Calibration (*defaults* in AI/Tech Constraints)
Missed-item rate	Proves the filter isn't quietly dropping news	Weekly audit of a sample of rejected items	Calibration; trending down
Campaign detection precision	False accusations are costly	Share of flagged campaigns a lead confirms	Calibration
Co-worker answer quality	One wrong answer to the CM sinks trust	Eval-set accuracy, citation correctness, users' useful/not-useful marks	Calibration
Correction rate	Shows where the model is weak	Corrections per 1,000 labels, per language and entity	Falling week on week

Metric	Why it matters	How measured	Target
Daily use	Proves the war room relies on it	Active users per day; questions asked to the co-worker	Every lead daily

Response and learning

Metric	Why it matters	How measured	Target
Response opportunities caught	The councillor-incident miss must not repeat	Share of moments the team later judges response-worthy that the queue raised first	Calibration; reviewed monthly
Time from opportunity to TVK response	Mileage depends on speed	Trigger time vs. first TVK leader post	Falling month on month
Error rate per capability	Shows the co-worker learning	Share of its output the team corrects, per capability and language	Falling week on week
Share of work at each stage	Shows the co-worker taking on more	Capabilities at Assist, Trusted and Co-worker	More capabilities move up over Phase 1

Lagging indicators (months)

Metric	Why it matters	How measured
Caught first	The war room hears before outside channels	Share of major Stories the war room saw before mainstream pickup, reviewed monthly
Narrative response speed	Responding before the narrative sets	Time from alert to TVK's first response post
Analyst hours saved	Clipping, scanning and manual monitoring time	War-room time logs, before vs. after

Metric	Why it matters	How measured
Product renewal and expansion	The client keeps and extends it	Contract renewal; more users or sources

Guardrails (must not get worse)

- Big-screen alerts per day (alert fatigue).
- Data-delay incidents and undelivered WhatsApp alerts.
- Share of corrections that soften criticism of our entities (bias guard).
- Platform-limit incidents (X reads cap, e-paper terms).

Stop or roll back if: after calibration, the team dismisses most big-screen alerts, or label accuracy on Tamil or Tanglish stays below the agreed bar, or a privacy incident occurs.

Decision Pre-Mortem

It is February 2027 and the war room has stopped looking at the screen. These are the three likeliest reasons.

#	Failure	Early warning	Mitigation or decision now
1	**Confident wrong answers in Tamil.** The co-worker and labels do well in English but misread Tanglish sarcasm. A wrong cause for a dip reaches CM Vijay, and trust collapses.	Tamil and Tanglish correction rates stay high; leads stop asking the co-worker questions.	Build the gold set from real war-room material before launch; per-language accuracy bars; reasons shown on every label; review before ally blame reaches the CM.
2	**Alert fatigue in campaign season.** Thresholds tuned on quiet weeks fire constantly during an event; leads mute WhatsApp and miss the one alert that mattered.	Rising share of dismissed alerts; WhatsApp read rates falling.	Severity tiers with a cap on the big screen; event-aware baselines; weekly tuning on act/dismiss data; the must-pass case always alerts (below).

#	Failure	Early warning	Mitigation or decision now
3	**Coverage gap on the day it matters.** X reads hit the cap or a key Tamil weekly has no feed, so the biggest Story arrives late or only in print.	Budget telemetry near cap; crawl health shows key outlets failing; print-only Stories appearing in clippings first.	Start X enterprise or vendor talks now; complete the outlet register with feed status; e-paper and clippings in Phase 1 to cover print.

Options considered and not chosen

Alternative	Why it loses
Multiple X accounts or apps to beat limits	Breaks X's Developer Policy; losing API access would blind the war room.
Volume-only alerts	Misses the one high-influence post and cannot see coordination.
One blended sentiment score	Hides when one viral account drives the number; weighted and raw shown together instead.
Fully automated campaign attribution	A false accusation can become the story; a person confirms before a party is named.
Feeds only for news	Many Tamil outlets and weeklies publish no usable feed; crawling their sites is needed for coverage.
Off-the-shelf listening tool	Weak on Tamil and Tanglish, no ally/opposition model, no correction loop.

Decisions that are hard to reverse

- **What appears on the wall when the CM or visitors are present.** Client-facing, hard to unsee. Presentation-safe mode is required.
- **Naming a party as behind a campaign.** Once shared, it cannot be taken back.
- **Storing personal data from X and news.** Retention and deletion rules must be set before ingestion starts.
- **The X data contract.** Enterprise or vendor terms lock in cost and coverage for a period.

Must-pass test

Two cases any build must pass, replayed from real or realistic data before launch:

1. **The councillor incident.** A rival party's speaker attacks CM Vijay at a public event; news reports and others' condemnations spread; no TVK leader has responded. Sajan gets a "Response opportunity" on WhatsApp within 5 minutes of the trigger, with the evidence and who is already reacting.
2. **The one post that mattered.** A verified national journalist's sharply critical post about CM Vijay, with no volume spike, reaches the big screen and team leads within 5 minutes of posting, with its reason shown.

Information needed from the war room

- Real past misses to replace the illustrative ones in the Problem Statement.
- The outlet register: Tamil and English dailies, political weeklies, TV news sites and YouTube channels. A draft list follows for the war room to confirm.
- E-paper subscriptions held, and whether their terms allow automated ingestion.
- The full list of parties and key leaders, with each party's relationship tag.
- The standing tiers: which journalists, politicians and influencers count as national, state or local.
- WhatsApp alert recipients (names and numbers of team leads) and routing by entity.
- A labelled starter set for the gold set (ideally past clippings and posts the war room acted on).
- Official TVK elephant artwork and the co-worker's name.

Draft outlet register (to confirm)

Type	Outlets
Tamil dailies	Dina Thanthi, Dinamalar, Dinamani, Dinakaran, Maalai Malar, Hindu Tamil Thisai
Political weeklies	Junior Vikatan, Ananda Vikatan, Kumudam Reporter, Nakkheeran
TV news (site and YouTube)	Puthiya Thalaimurai, Thanthi TV, Sun News, Polimer News, News7 Tamil, Kalaignar Seithigal
English (Tamil Nadu desks)	The Hindu, The New Indian Express, Times of India Chennai, DT Next

Type	Outlets
National	NDTV, India Today, The Indian Express, Hindustan Times, The News Minute

Each outlet is ingested from its feed where one exists and by crawling its website otherwise. Party-affiliated outlets are flagged as partisan in the outlet weights.

Decisions needed now

1. **Start X enterprise or firehose vendor talks now?** Recommended: yes. The 3M reads cap will not cover all parties, campaign detection and the backfill from 2026-05-10, and contracts take time.
2. **Who confirms campaign attribution and ally-blame in CM summaries?** Recommended: Aadhav Arjuna names two leads, one per shift.
3. **Which default thresholds to start calibration with?** Recommended: accept the defaults in this PRD as starting values, and review them together after two weeks of live data.
